

Wedge Set

"Reduces packing wear"

Construction: 2 piece male & female, skive cut, moly glass-filled PTFE (black), glass-filled PTFE (white – non-contaminating), or virgin PTFE (white).

Temperature: to 500°F

Service: The wedge set is installed at the bottom of the stuffing box or the first ring in. A properly installed wedge set effectively restricts the flow of abrasive solids into the stuffing box. Used in place of the bottom or first packing ring, the Palmetto Wedge Set creates an interference fit against the shaft and against the bore. When used with the correct packing, the Palmetto Wedge Set will reduce packing wear and extend packing and shaft sleeve life.
